Abstract

The paper discusses two of the most crucial issues for India in the field of IT. First of them is the low employability of Information Technology and Computer Science & Engineering students. The employability of IT students has decreased considerably in past years. The other issue is the condition of e-governance initiatives in India. The programmes need to get more inclusive and innovative. It identifies the challenges and the areas in which work needs to be done in these spheres. It also suggests interconnecting the two to eliminate each other's setbacks. Through this suggestion, it points towards the benefits that the students and hence the nation can gain in the long run.
